ILT-SS-04-AI Adaptability Assignment

***“I believe I’m the best in machine learning because of my math”***

**5 Whys:**

Since elementary school, I’d joined the math olympiad and I believe machine learning is nothing without math. By knowing math, it’s easier to create a fine-tuning model. But, I wanna improve. There must be someone better than me. I should do that for the sake of finding space to be better.

***“I still can be better because sky’s the limit”***

To overcome the challenge, I’ll keep learning using many references and joining related communities to discuss with and know others’ insight.

***“I’ll never be good at my current-not-good-at skill”***

**5 Why:**

I thought it was useless to try something clearly I was bad at. It’s just a waste of time. I should use time to sharpen what I’m good at. Time is limited. No one knows when it will end.

***“I should try, it’s okay if I can’t be good at first try”***

I’ll cluster skills based on how related to my interest. Then, I’ll approximate the effort and attempts that should be given. Lastly, I checked how far I’ve improved and I evaluate whether I should try again or not.

***“I don’t wanna say ‘hi’ first to old friends/someone new”***

**5 Whys:**

I’m too shy to do it. I’m afraid of being ignored. I thought my voice was very low and unclear. Maybe I’m just not used to speaking louder. I don’t wanna cross the line.

***“I wanna be easy-going and friendly person”***

To achieve that, I plan to get used to greeting the closest one first and the scope will become bigger iteratively. As well, I’ll say ‘hi’ to neighbors/colleagues who pass by. I determine a minimum criteria of times I greet people per day to ensure the progress is going well.
